

Quiz on 0.2 reading:

According to Galileo, the strength of a plank of wood is proportional to:

- a) its cross-sectional area ✓
- b) its volume
- c) its density
- d) its surface area ~ 1/2 credit
- e) its linear density

Reading - due 1.1, 1.2

$$x^2 = \frac{1}{2} g t^2$$

$$x^2 - x_0^2 = \frac{1}{2} g t^2 - \frac{1}{2} g t_0^2$$

$$\frac{x^2}{x_0^2} = \frac{\frac{1}{2} g t^2}{\frac{1}{2} g t_0^2}$$

$$\int_{x_0}^{x^2} g x = \int_{t_0}^{t^2} g dt$$

$$g x = g dt = g dt$$

$$\frac{g x}{g} = \frac{g dt}{g}$$

$$x = t$$

$$x_0 = t_0$$

$$x = t$$

Solutions to HW assigned 1/20

$$0-6: 134 \text{ mg} \times \frac{1 \text{ g}}{1000 \text{ mg}} \times \frac{1 \text{ kg}}{1000 \text{ g}} = 134 \times 10^{-6} \text{ kg} \\ = \boxed{1.34 \times 10^{-4} \text{ kg}}$$

0-13: The units are wrong:

$$1.54 \text{ m/s}^2 \times 3.29 \text{ s} = 5.07 \text{ m/s}, \\ \text{not } 5.07 \text{ m}.$$

0-18 a) b : meters
 c : meters/second \leftarrow (because ct must be in meters)
 k : seconds

This assumes we make the simplest choice of meters & seconds for length and time. I suppose you could choose furlongs and weeks, but it's not recommended...

$$b) \frac{dy}{dt} = 0 - c(1 + k \cdot e^{-t/k} (-1/k)) \\ = c(e^{-t/k} - 1)$$

c) The terminal velocity is $-c$.

$$d) \frac{dv}{dt} = c(e^{-t/k} (-1/k) - 0) = -\frac{c}{k} e^{-t/k}$$

e) For t large, $e^{-t/k}$ is small, so acceleration $-(1/k)e^{-t/k}$ is ~~then~~ small.

20 a) $v_f^2 - v_0^2 = 2a\Delta x$

v_0 = velocity of earth's rotating surface

$$v_0 = \frac{2\pi R_{\text{earth}}}{1 \text{ day}} = 4.6 \times 10^2 \text{ m/s}$$

$$a = 3g$$

$$v_f = 7.9 \times 10^3 \text{ m/s}$$

$$g = 9.8 \text{ m/s}^2$$

$$\Delta x = ?$$

$$R_{\text{earth}} = 6.4 \times 10^6 \text{ m}$$

↑ (in back of book)

To 2 sig figs, both

v_f^2 and $v_f^2 - v_0^2$ equal

$$6.2 \times 10^7 \text{ (m/s)}^2, \text{ so}$$

we can ignore v_0 .

$$v_f^2 = 2a\Delta x \Rightarrow \Delta x = v_f^2 / (2a) = 1.1 \times 10^6 \text{ m}$$

b) $1.1 \times 10^6 \text{ m} = 1100 \text{ km}$ is ~~too~~ too long for a practical rail gun.

Next HW, due 1/27:

Chapter 0: # 24, 25, 26, 35, 37

mass = density \times volume

$$m = \rho V$$

$$\rho = 1 \text{ g/cm}^3 \quad (\text{H}_2\text{O})$$

$$V = 1 \text{ m}^3$$

$$m = \frac{1 \text{ g}}{\text{cm}^3} \times 1 \text{ m}^3 \times \left(\frac{10^2 \text{ cm}}{1 \text{ m}} \right)^3$$

$$m = 10^6 \text{ g} \times \frac{1 \text{ kg}}{10^3 \text{ g}} = 10^3 \text{ kg}$$

If I double
the volume but
keep the shape
constant, what
is the ratio of
the new height to
the old height?

~~3/2~~ $\sqrt[3]{2}$

$$(2x)^3 = 8x^3 \Rightarrow 2 \text{ too big}$$

$$1.5^3 = 3.375$$

$\Rightarrow 1.5$ too big

$$V = kL^3 \quad 2 = \frac{V_{\text{new}}}{V_{\text{old}}} = \frac{kL_{\text{new}}^3}{kL_{\text{old}}^3}$$

\uparrow k depends on shape

$$1.26 = \sqrt[3]{2} = \frac{L_{\text{new}}}{L_{\text{old}}} \leftarrow \left(\frac{L_{\text{new}}}{L_{\text{old}}} \right)^3$$
